
IE CSS

Posted by Bossman45 - 2010/11/19 23:17

I see that thsi module places a IE conditional statement in the source code. I have need for a IE 7 conditional statement and am wondering if ARI EXT Menu conditional code negates my code which is listed below it. For example:

Mine=

Hello,

You can use as many conditional statements as you want. The module shouldn't negate your CSS file.

I am speaking of only the module's conditional statement. It's strange. When I place my IE 7 code in that css file it has an effect. When I target it from a separate conditional the code does not work at all.

Here is a link to the site.

http://www.mydhp.com/UCI_Dev/index.php?option=com_content&view=frontpage&Itemid=1

The problem is only with IE 7. Thanks.

It seems this problem occurs because CSS file which you try to load doesn't exist. You can see if try to load this file into browser:

<http://www.mydhp.com/templates/ucimainpage/css/ie7.css>

Looking at the file on FTP now. It does exist. I've developed many Joomla sites and never ran into such a sticky problem with conditional css. It is just strange that if Input my code into the menu css and put in the same course css setting (used to check that the code is working) it works. But I do not want to put core code in the menu css. I just may have to do that.

The code works in menu module CSS file because this file exists. Read our previous post please. If you try to load your CSS file in browser, you will see error. If file exist, a browser should open it without problem. Keep in mind, if your server is under UNIX system, file name is case-sensitive.
