## Flickr template

---

Hi all,

I would like to use a template style in the way the flickr gallery does (Pin, etc.) when I use just a single flickr image. If I chose this option I just get a template textarea. However, if I enter HTML code there it is filtered when saving. So, what is the syntax or commands I can use there?

Because if I could save HTML code there I could simple take the HTML snippets from the flickr gallery stuff. If there is another more elegant approach I'd glad to hear it.

However, this is a very nice plugin and worth the money.

Hello,

Download and upgrade "ARI Sexy Lightbox" module and "System - ARI Sexy Lightbox Anywhere" pugin please. New version should save HTML code correctly.

Regards,  
ARI Soft
