
not launching from custom slider

Posted by thenakedspike - 2011/10/12 18:55

I'm trying to implement sexylightbox here: <http://r1sitebuild.com/Joomla15/index.php/creative> from within a customized version of easysliderPro.

While I can pop a lightbox from articles, the links are generated dynamically, Href from the php for the module and class declaration/HTML content via Javascript in the module. I think this is bypassing the event that Ari uses to scan for elements to place in its lightbox method. (I'm currently ruling out Javascript conflicts because I can successfully load lightboxes from the article) Is there a global method I can call that will trigger the lightbox anywhere or sexylinks to be added?

Hello,

"ARI Sexy Links" plugin calls the next javascript code on your site:

```
ARISexyLinks("a.lightbox", "width=500&height=350&tmpl=component", true);
```

Regards,
ARI Soft

Yes, however the links in the image slider are a links with a class of lightbox and they are opening in a new page. Are you saying that the lightbox code is being added to the stack even when the links are opened in a new window? If so do you recommend an event.preventDefault() in my slider js file to prevent the links from opening? Thank you for your support.

"ARI Sexy Links" calls provided code on DOM ready event, but the slider is created on window load event and it happens after DOM ready so slider links are not shown into the lightbox. You can add call the next code in slider:

```
if (typeof(ARISexyLinks) != "undefined")
jQuery(window).load(function() {
    setTimeout(function() {
        ARISexyLinks("a.lightbox", "width=500&height=350&tmpl=component", true);
    }, 10);
});
```

Regards,
ARI Soft
