## Fancybox call from jQuery

Posted by stephanbeek - 2015/03/16 09:36

---

I have to update a part of a website page with a {fancybox} inside. Of course, after the page is loaded, the {fancybox} is translated into a with a fb class. For example:

I now make an Ajax call to the server to retrieve another image to display, for example test2.jpg.

What is the jQuery syntax I could use to make a new "fancybox" call to that new image test2.jpg.

The problem for me is, because the call generated by fancybox for the first does not have an item id, I cannot retrieve the class used for that first .

I tried giving an id into the first fancybox ( {fancybox id="myID" url=".."} ) but this id "myID" gets lost after the translation by fancybox.

Regards  
Stephan.

Hello,

It is possible to "class" parameter for {fancybox} tag to specify a CSS class which will be added to tag. You can add an unique class name and get the element by CSS class name (jQuery supports this ability).
