## add css class not working?

Posted by stefyxz - 2013/08/26 03:33

---

I put 3 slideshows inside an article, and they need to be styled differently.

One is full width at the top of the article.

Another should be floated left inside a paragraph.

Another should be floated right.

I try to add a class under: OPTIONS / Module Class Suffix, but the modules don't get the class in the article.

How to fix?

There is also another problem with adding the slideshow in the articles.

Each slideshow gets an empty paragraph just before:

before itself. This happen even when the tag {arislideshow moduleId="xxx"} is inside anther paragraph. This changes the intended layout.

How to avoid this???

Hello,

"Module Class Suffix" parameter are defined in Joomla! modules, but it is used by site templates when modules are loaded into module positions which are defined in site templates. This logic is used by Joomla! system.

In your case you can wrap plugin code with element with specific CSS class to add custom styles.

About

tag, it is not added by the extension. We suppose the tag is added by WYSIWYG editor which you use in articles.

Thank you. I wish it was so simple, but unfortunately it does not work!

The module is already wrapped in a div (in ADVANCED OPTIONS, MODULE TAG), and it is supposed to have a class (from BASIC OPTIONS, MODULE CLASS SUFFIX).

The module just doesn't get any class. Other modules work, like slideshow CK, and they take their class as supposed.

I like your module better, it has much nicer transitions. But this doesn't work, I already tried as per your advice. It simply doesn't get any class!

Another problem: your module breaks other javascript plugins, they stop working when your module is loaded in the page. But they work properly when other slideshow plugins are loaded instead....

---

Any solution?

Where we can see the problem with other extensions?
