Multiple sliders

Posted by Mosler - 2014/10/07 01:59

_____

Hello

I have 2 ARI Image Slideshows modules on separate pages of my site, each one having a separate subdirectory for its images, like :
Images/my_images/sub1
Images/my_images/sub2

The first I installed works fine :
Module assignment : only page1
File ariimageslider.ini is in /sub1 with the images, and tells : x.jpg="sub1"
Configuration file : ariimageslider.ini
Images path : Images/my_images

My problem is to tell the other module how to find its own images.
I have :
ariimageslider.ini in /sub2 with its images and it tells : y.jpg="sub2"
Module assignment : only page2

I tried different solutions, mixing :
Image path : images/my_images
or Image path : images/my_images/sub2
with
Image path : images/my_images
or image path : images/my_images/sub2

I got three kind of results :
- No slider showing at all : blank page
- Slider with images for page1 working in page2 !
- Slider working in page2 with images expected, but surronded by a syntax error message.

So, what should be the right method for multiple modules ? (not listed in Description file). I have not found the answer in ten pages of forum...

Thanks for your help http://www.ari-soft.com/images/fbfiles/images/Syntax_error.JPG

_____

Hello,

Create a new module instance for the second slider (you can read how to do it here) and populate "Image path" parameter with images/my_images/sub1 value for the first slider and with images/my_images/sub2 for the second slider.

Regards,
ARI Soft

_____

http://www.ari-soft.com/images/fbfiles/images/1__2_.png I have four sliders on the same page, each one has about 15 images. . They get these images form different sub-folder. But when I click one of them, I can browser from the first image to the last image(60th). Do you know why?

_____

It is a behaviour of a lightbox which you use with the slider.

Ah, ok, I'm new to Joomla, I will check the lightbox.
Another problem, I can't show the title of the slides. I checked the "Show Title"option but it doesn't work.

_____

If you mean modules titles, they are not shown directly by a module, they are shown by a site template (if a module is load into a module position) or a 3rd party extension which is used to load a module into an article (or other content). Probably a plugin which you use to load modules doesn't support ability to show modules titles or require an additional parameter.

ok, thank you.

I worked it out.
I changed the issue with light box.
I also add the title field in the themplate.

Cheers,
Thank you very much.
