How to use my own created thumbnails?

Posted by WoodyOnline - 2011/07/10 15:30

_____

Hello,

I'm trying to use my own created thumbnails.
There is an option to enter a thumbnail path, but I don't get it to work.
I'm doing something wrong... :blush:

I've tried:
If you want to use your own thumbnails instead of auto generated thumbnails use 'Thumbnails path' parameter for this purpose. You can use predefined variable {$fileName} in value of this parameter. {$fileName} contains file name of original image. For example you want to use thumbnails from 'thumb' subdir in folder which contains original images and thumbnails will have the same file names as original images, then specify in this field 'thumb/{$fileName}' value.

I want to use the file "thumb.png" from the directory "images/thumbs/".
How does this work? What do I have to fill in?

Kind regards, Woody

_____

Hello,

"Thumbnail path" parameter contains relative path, relative to directory with images. Could you specify folder where original images are stored?

Regards,
ARI Soft

_____

Hello,

The original images are stored in the folder: images/fotografie/lucht
The thumb (for the photogallery "lucht") is stored in: images/fotografie/lucht/thumb

CHMOD of the folders are all set to 777.

The site:

_____

If thumbnails have the same name as original images, set "Thumbnail path" parameter to thumb/{$fileName} value.

Thanks! Problem solved!! :woohoo:

Problem was the filename of the thumb. It wasn't the same as the original image.
Many thanks for your help and quick response!

Kind regards, Woody
