Will ARI Photo Gallery work with Joomla 3?

Thanks. It does work, but I do have a small problem! Unsure whether its ariphotogallery or the template (created by artisteer) but would suspect the template.

When an image, displayed by anywhere, opens and plays, the slide show appears behind the menu and web page banner.

I'm developing the web site under Joomla 3 and currently it only contains one page:

<http://joomla3.heswallphotosoc.co.uk/>

I would be very grateful for any suggestions.

Many thanks.

What browser do you use? Could you send a screenshot where we can see the problem?

PS: We can't reproduce it in FireFox browser.

That was my fault! I can make it happen in Firefox (see attached) or IE10.

I had tried to change the z-index statements on the first line of your black.css and white.css files to 99000 and 99100, as per:

```
.mb_overlay{z-index:99000;} #mb_gallery_{z-index:99100;} .mb_overlay{
```

but it didn't seem to have any effect. so I left them changed.

In response to your comment above, I reviewed what I'd done and found it was indeed working. I then changed the z-

---

index values back to their original, closed the browser and reloaded and my problem was back (see attached). I then changed the values as above, closed and reloaded the browser and everything was working as expected.

I don't know if the values I chose above are realistic or not, but I hope this helps.

Regards
