
Some problems and issues

Posted by aliroman - 2009/09/04 08:38

Hello everybody!

1) I have some problems with user results after selftesting.

If i check out on box "Quizzes - %test% - "Show full results"", after quiz there is nothing showing.

If i check on it, user can see all results, but this not we need.

We need user could his results of quiz, BUT without right answers. So I need to remove column "Right answer column" in full user results.

2) I have installed all by this way:

Windows 2003 R2

Apache 2.2.11

PHP 5.2.9

MySQL 5.0.45

PHPMyAdmin

LDAP (authentication over AD)

I need to make quiz at october for 600 people at one moment. How do you think, can this server/cms/component withstand the load. Maybe there are any advices? I would happy to hear anything))

Excuses for my english and big thanks for help!!!

Hello,

Regarding your questions:

1) About the first case, it seems that you didn't choose text template or result scale. If you choose one of them, you will see text on final page which you can define on text templates page. About the second case, unfortunately the component doesn't support possibility for hiding correct answers. But you can submit feature request here and we'll implement it in one of the future releases.

2) We will release the new version of the beginning of next week. This will include bulk edit feature for quizzes, questions and question categories, copy and move feature for quizzes and questions. After this, we'll test the component on test server with large amount of quizzes data and release new version of the component with updated SQL queries and tables if necessary. We are going to release new version with improvement performance within 2.5 weeks. This improvement will help reduce the load on the server for large data, but you must understand that the capacity is also dependent on the capabilities of your server and Joomla!.

Regards,

ARI Soft

Thanks for answer!

Concerning second question:

What capabilities of server we need to test 600 people per one moment?

It's wonderful news about new release, but i need to close this project 15 october, cause we should have test of employees... Maybe any advices for configuration of server for maximum perfomance? maybe there are any components? maybe caching or something else?

Im very afraid if server will go down after all people will connect to have test...

Hello,

Exact answer requires stress testing on your server and it depends on how many requests will be handle by web server per second. You can try to use some additional tools for your web server like web server accelerators, load balancing tools.

Admin! Thanks for answers.

Just a little please.

Cause of all of files are encoded and i can`t modify anything, can i ask you to remove column right answers in user results templates and send me this file. This is very important for us.
