
The quiz is making stress to the server.

Posted by TemnyProrok - 2009/09/04 09:12

Has anyone problem with stress for the server?

We are trying to make s website with tests, but on our first webhosting, where we were trying to use the ariquiz we reach the stress limit with about 70 people (about 120 quizzes in one day).

On second hosting we were trying the stress test and we reach their limit after 10 minutes of continuously doing tests (cca 60 tests)

Could the problem be, that the component is Base64 coded?

Sorry for my english.

Regards,
Temny Prorok

Hello,

Could you say your server parameters? Is it dedicated server or virtual server? Server is gone away with PHP error or MySQL error?

Oh, there is no error. Just both hostingproviders are measuring the load for the CPU. On one server it is set for 13,75 Tera instruction per day and after reaching double the limit they shut down the presentation for the rest of the day.

On the second one it is some kind of on fly measuring and in case of high load, the stop the presentation for couple of minutes. Then is the server back operational.

In both cases the web is on shared server with other presentations, and thats propably why they are monitoring the load for the server.

Could you indicate, it's new problem or it's problem which you have earlier when you contacted with us approximately 1.5 month ago?

Its a new one.

Las time, there was a problem wit SEO and in thle LOG file was a mess. But now the log file is clean. But just for one quiz of 5 image questions is used approximatly a 1G instructions of the processor which is a second of full computing of 1GHz processor.

I am just triing to find, where the problem could be with the new webhosting provider, because the old one is quite not communicative.

It looks like the problem with load on server is in eval() function

Hello,

Why do you think so? Could you describe it in more details?
