Hello,

I would like to know if the upgraded version can help me with my Quiz. Would be nice if you could help me :)

I have on quiz

This quiz is divided into 4 different categories

Each questions has 4 different answers and depending on which answer the customer is choosing he will receive different points (only one answer is possible)

Result:

How many points did the customer achieve in each category?!

Example:

Questions 1 (Belongs to Category 1): Answers: A (1point) B(2 points) C(3points) D (4points)

Questions 2 (Belongs to Category 2): Answers: A (1point) B(2 points) C(3points) D (4points)

Questions 3 (Belongs to Category 1): Answers: A (1point) B(2 points) C(3points) D (4points)

Result:

How many points does the customer have in Category 1 and how many in Category 2?

Do you think you can help me with this?

Cheers

=====

Hello,

"ARI Quiz" can show results by each question category at the end of a quiz. It shows it the next format:

Category 1 | UserScore / MaxScore (PercentScore%)

...

Category N | UserScore / MaxScore (PercentScore%)

For example:

Category 1 | 5 / 10 (50%)

Category 2 | 1 / 10 (10%)

Category 2 | 14 / 20 (70%)

It is possible to set specific score for each answer for "Single Question" question type in percent from maximum for score. For example it is possible to set maximum score to 4 points and score for the first answer to 100%, for the second to 75% and etc.

Regards,

ARI Soft
