
How to call ariquizanywhere plugin?

Posted by blaztoma - 2014/12/08 11:23

Hello,

Basicly, i get the text content as a string which has unparsed {ariquizanywhere ...} tags.

How do i get that string parsed?

Basicly, i've tried something like:

```
JHtml::_('content.prepare', $contentString);
```

But it appears the plugin doesn't belong to content group.

Thanks,

Tomas

Hello,

"ARI Quiz Anywhere" is a system plugin and it doesn't require to call any additional PHP code. The plugin parses plugin code automatically. Check that the plugin is enabled.

The plugin itself works - it's no problem. I can see it working perfectly in articles.

The problem is that i get content other sources (components) and use API which probably does not run plugins on the content.

Therefore i really need to run the plugin on the text string manually.

The scenario is:

ajax call to get the content

...

```
$contentString = CobaltAPI::ItemsStore->getRecord(id);
```

```
$value = json_encode($contentString);
```

...

send back to browser

replace container with content string

...

The content is not displayed anywhere (just - client side) - maybe that's why plugin is not run.

The plugin works fine in any content (not only in articles), but if plugin code is available on server side. The plugin parses code in "onAfterRender" event handler.

You can find event handler in /plugins/system/ariquizanywhere/ariquizanywhere.php file. You can try to adapt it for using in your AJAX call.
