
Parse Plugin Tags

Posted by BurlingtonGreen - 2016/01/25 15:34

I realize that the Parse Plugin Tags feature is experimental but I was wondering if it works not only for questions but question category descriptions? I have tried it in a description and it doesn't seem to work. Is there an easy way to enable this?

Thanks

Hello,

It can be easily added for quiz description or quiz category description, but it requires custom modification for question categories description.

Is it something you can add for the next version?

Any chance you can let me know what file and line needs the change?

For quiz description and quiz category description can be used the following PHP code:

```
JPluginHelper::importPlugin('content');  
echo JHtml::_('content.prepare', $content, '', 'com_ariquiz.content');
```

For question category description at least it requires to modify /controllers/com_ariquiz/controllers/question.php file.

How can I support the jce media box system plugin on the question page?
Linl

I tried to edit controllers/com_ariquiz/controllers/question.php
but it does not work

Sorry, don't have an experience with integration this plugin with "ARI Quiz". "ARI Quiz" supports content plugins in questions when the plugins use standard Joomla! content plugin API.

Regards,
ARI Soft
