Answer categories?
Posted by Stantz - 2010/07/29 08:09
_____

Greetings,
My problem is:
Recently installed Ari Quiz, trying to make something more complicated than "true/false" or score test "if score = 0-10 then display following" type of quizes.

What I need is, for example

"Question 1:
Answer a)
Answer b)
Answer c)"
And when user will answer "Answer c)" it'll add scores to category "Example" but if he answers "Answer b)" it'll add score in "Example 2"

Problem with current score system that it'll not allow such thing and make it overcomplicated.

For instance: right now if I want to create quiz based on example above I'll need to manually calculate each and every answer, which is tedious by itself.
But what if, for example, I'll deal with it, and calculate manually all answers, there's 2nd problem, which is multiple answer scores, example again:

"Question 2"
"Asnwer a)
Answer b)
Answer c)"

If user will choose "Answer b)" it'll add scores to "Category 3 AND Category 4" and based on it, it'll show user "personality" or different results.

I hope anyone can understand what I'm trying to say, but I really need this functionality :unsure:

Hello,

If need to display different text on quiz final page based on earned score, 'Result Scale' can be used in this case. In result scale you can define score ranges (in percent) and choose text template which will be shown in quiz final page if a user earned score from specific score range. When result scale is created, it can be selected in quiz settings.

Regards,
ARI Soft

_____

Yeah, I understand that this functionality is available by default. But I was talking about different things.

_____

Sorry, but could you explain your requirement in more details, for example, describe necessary quiz with 3 or 4 questions

and explain what the component should display at the end of the quiz?

Regards,
ARI Soft

_____

Yeah sure, example would go like this:

"Question 1"
Answer a)
Answer b)

User Answers "a" and then quiz adds 1 point to "answer category 1"

"Question 2"
Answer b)
Answer c)

User answers "c", quiz adds 1 point to "asnwer category 1" again

Etc

So, whole purpose of this "answer category" would be IF question would be like this:

"Do you like working with heavy machinery"
"a) Yes"
"b) No"
If user answers "Yes" then Quiz will add 1 point to job suggestion, based on the answer. So our user likes to work with heavy machinery, then we add 1 point to "Crane operator" and 1 point to "Lifter driver"

Based on this category answers quiz will shorten the search for the user, in such quizes as "Choose your profession" and simply NOT giving him list like "These are professions that suitable for you:"
"Profession 1
Profession 2
Profession 3"

It'll just give him 1 profession, that based on his answers, which are in category.

Once again, sorry for such a long description of what I need :unsure:

_____

Thanks for the explanation, the component doesn't provide possibility to calculate score for different score categories inside a quiz and our roadmap for the near future does not contain this feature.

Regards,
ARI Soft

_____

Thanks for the answer. No, it wouldn't be critical.
But some functionality based on scores, to ease the process of calculation would be great too. Though I can't see how's this possible, but we're talking future right?

Anyhow, thanks for the support, will monitor future updates of this awesome component :)

_____

Thanks for idea, we'll think about implementation of this future.

PS: If you have any ideas how to improve the component you can submit it here.

Regards,
ARI Soft
