
Table not showing fully in quiz

Posted by The Cheadle Academy - 2016/11/01 18:54

Hi,

Strange one as Ive set the table width as 90% in the question, however when it is displayed on the screen it is cutting half of the table off and is not allowing the user the option to even scroll along to view the other end of the table. Is this a bug in the quiz or something that I am doing wrong? This is happening when im trying to use the multiple free text question, however im hearing from students that it happening on some other tables that I have created in quiz questions.

Hello,

Is it possible to see the problem anywhere?

Regards,
ARI Soft

This problem HTML code which is used in the question (HTML table). If want to do it responsive, add "table-layout:fixed" CSS property to it or create DIV-based layout instead of TABLE-based.

Thanks. All is sorted now.

Another question / suggestion. Is it possible to have the ability to set the width of the text box that gets inserted in these questions? It would be useful if you could set the width of these on a question basis.

Also is there a way on a timed quiz that has just one question, where they have multiple boxes to complete, the ones that they have completed will be graded when the time runs out? At the moment if they run out of time, it will give the result as 0 marks, even if some of the answers they completed were correct.

To save answers when timeout occurs, edit /components/com_ariquiz/controllers/question.php file. Find "ajaxSavePage" method and replace the following code:

```
$skipTimeOver = false;
```

with the following one:

```
$skipTimeOver = true;
```
