
Vertical slide effect

Posted by somethingclever - 2011/07/12 18:24

I have made some modifications to Ari paginator to achieve multiple columns.

I would also like to modify the module so that the slide effect is vertical rather than horizontal, can someone help with this?

Im currently working on the script.js file is this the right place to look?

Demo:

http://test5.certico.co.uk/index.php?option=com_content&view=article&id=8&Itemid=2

made some progress:

edited script.js around line 45 (de-minified the code first)

```
o.click(function (e) {
    $(this).addClass('active').siblings().removeClass('active');
    n.stop().animate({
        'marginTop': -((parseInt($(this).text()) - 1) * f.height())
    }, c.moveDuration, c.moveFx);
    if (q) clearTimeout(q);
    if (c.auto) {
        q = setTimeout(function () {
            p()
        }, c.pause + c.moveDuration)
    }
    e.preventDefault()
});
```

Just need to fix height detection and I think I will be there :)

Re:Vertical slide effect

Ok, height problem is caused by my 3 columns modification... guess I Just need to divide height by 3 somewhere ;)

Re:Vertical slide effect

Working now :)

in script.js changed line 16 (de-minified):

```
g.each(function () {
    var a = $(this);
    a.data('height', a.outerHeight(true)/(3))
});
```

As for multiple columns I achieved this by changing default.php template line 23:

Also added float: left; in style.css:

```
.aripag-holder li.aripag-item {  
float: left;  
width: 280px;  
list-style:none;  
margin:10px 10px 0;  
padding:10px;  
overflow:hidden;  
}
```

I hope that helps someone, maybe the author could include the above functionality in a more elegant and customisable way ;)

Hello,

Sorry for the delay. Is it required any help from our side?

Regards,
ARI Soft

Hi,

I think I have things almost exactly how I need now. I posted the steps for the benefit of other people who might want to achieve vertical slide transitions. I also thought you might want to include the changes in the next version of your module and link them properly to the administration back end so they are easy to setup for everyone.

I now just need to move the "previous" and "next" button to the top and bottom of the slider module respectively and I will have exactly what I need for my site.

many thanks for a great module :)

Hello,

I tried this as I need to have multiple columns, but the module stop working after the JS. file edit, and without editing it, the module height is too big.

I have no knowledge what so ever of js... by the way :-)

Thank you for an answer.

Hi, is there a way to have the items displayed horizontally and not vertically ? I used this post, but I as mentioned, I get height problems after modifying the php and css only (I have no JS knowledge!

<http://www.shaperumors.com/index.php/mijn-ontwerp-uploaden>

Thank you for the help. Kind regards

Arnaud Bezat

Hello,

Return /modules/mod_aripaginator/includes/js/themes/default/styles.css file to original state and the module will work fine. The extension doesn't provide ability to shows items in horizontal instead of vertical.

Regards,
ARI Soft
