readmore_link

Posted by jimbits - 2011/12/02 22:06

_____

I used the {$readmore_link} variable for the Paginator template parameters and rather than a "Read More" link, I see a portion of the URL for the article (/index.php?option... etc.). Suggestions?

_____

Perhaps it has something to do with the fact that I was unable to install plg_system_ariextensions? I received the message, "Could not find a Joomla! XML setup file in the package."

_____

Hello,

{$readmore_link} predefined variable contains only a link, not HTML code. It can be wrapped with necessary HTML code (for example if you want to create an image link). If you want to use a simple HTML link, use the next code:

Read more...

"System - ARI Extensions" plugin is requires only for Joomla! 1.6+.

Regards,
ARI Soft
