CSS Conflict

Posted by kokoruz - 2010/08/02 21:09

_____

I've disected the CSS in my project to discover why your module is displaying differently from the demo.

Part of the css in my main content area that controls the appearance of my lists is butting heads with your modules

#center-main-body ul li {list-style:disc; padding:0; margin:0.0em 0 0.5em 1.5em;}

If I comment out this line of code in my project your module displays as expected.

All of the styling for your lists have a class assigned to them. I can't figure out why my style it taking precedence over your styles that have a class asigned to them. Perhaps an ID carries more weight than a class?

Please help,

K.

_____

Hello,

Yes, ID has more weight than CSS class because it's more specific selector. In your case, you can add the following CSS rule:

#center-main-body .aripag-main UL LI.aripag-item
{
  list-style: none outside none;
  margin: 10px 10px 0;
  padding: 20px;
}

Regards,
ARI Soft
