
How 2 use ?

Posted by wOrker - 2011/05/12 08:28

Hi, I can not understand how to present the data in the table. I need to bring a list of articles with the ability to sort by price, number, name, etc. Where each item is a reference to this article. How to do it? HELP is not informative description of the main functions but you can begin using it is not clear.

Hello,

If you want to display data from database, specify "SELECT" SQL query which will select necessary data in "Choose source type -> SQL -> SQL query" parameter. If you provide structure of table(s) from what you want to select data, we will help to create SQL query.

Regards,
ARI Soft

Re:How 2 use ?

Posted by wOrker - 2011/05/12 09:23

thanks for the reply

Suppose I have five articles, each containing a description of the inside of the restaurant, cost per location, capacity, address, name, etc. These parameters should be obtained from the article and put in a table according to these parameters to sort the data. Is this possible? To be honest I myself can not make an SQL query, you can help?

ie editing the article, the table will automatically be updated.

The format of the paper consists of, photos, descriptions, and key points: name, address, phone number, capacity, cost per location, etc.

In the article itself can be accessed through a link in the table

Sorry, but do you mean Joomla! articles? Do you have Joomla! article with text which contains some information about name, location and price? If yes, the extension can't get this information. It can get fields from SQL table or CSV file.

Re:How 2 use ?

Posted by wOrker - 2011/05/12 09:35

Yes I mean joomla articles. Well then tell me how best to solve this problem, so no need to update a separate table, and article? Once you can automate this process?

=====

Re:How 2 use ?

Posted by admin - 2011/05/12 09:42

For example you can create CSV file with columns which will contains name, location, price and other fields and create table based on this file.

Re:How 2 use ?

Posted by admin - 2011/05/12 09:43

BTW, we can try to help data from articles, but in this case articles should have the same HTML layout that have possibility to parse article and select necessary fields.

Could you tell us about the mechanism? How does it work? I do not have representation, and never faced a CSV.

I understand the server is a CSV file with a table which is formed and how they will shape the article? Sorry for stupid questions, how to implement it? This third-party component? Or manual refinement of the site?

CSV format provides ability to create simple spreadsheet, you can use OpenOffice application that create and edit CSV files. For example you can create CSV file on your local computer with necessary information, upload it to your server and indicate path to CSV file in "ARI Data Tables" module settings. You can article ID field to table from CSV file that associate rows in CSV file with Joomla! articles.

If you wish, you can provide some information what you want to display on your site, temporary access to your Joomla! backend by email and we will setup demo on your site.

Regards,
ARI Soft

I read about the CSV file and then that opens in Excel, see the table format. I'm interested in how other joomla can create article based on this file. If you were shown a demo would be great!

Access will send you 5 minutes to your email, thanks.

Re:How 2 use ?

Posted by admin - 2011/05/12 10:13

Joomla! can't create articles based on CSV file, but "ARI Data Tables" can show data from CSV file. You can create CSV file and articles separately and then assign CSV data with articles with column in CSV file which will contain article ID.

Thank you very much for the demo, as yet not fully figured out. Added a new item in the CSV, created article, said her ID, for some reason lost links. I understand when you update the information need to update a table, then separate each article? I mean those items that will be displayed in the table itself.

Re:How 2 use ?

Posted by admin - 2011/05/12 11:20

Yes, data from CSV file is used separately with data from article. When you create new article, add new row to CSV file with necessary information and article ID.

PS: We can configure the module that it shows data from articles from specific content category, but in this case all articles should have the same format for showing fields which you want to show in table.

Regards,
ARI Soft

Re:How 2 use ?

Posted by wOrker - 2011/05/12 11:30

Yes, I will have a single format for displaying articles in this category, the articles of restaurants will be decorated according to a single template. But in an article in contrast to the table will be a lot of other information, including videos, may flash, pictures, descriptions, and so on. A table displays only basic information, the rest is ignored and not displayed

in the table. Is it possible?

=====

Re:How 2 use ?

Posted by admin - 2011/05/12 11:37

Potentially it is possible to get only necessary information for table, but could you create two (or more) articles and say us about it. After this we will help to configure the module that it gets necessary information.

PS: Could you specify what link doesn't work? Demo page looks normal and all links work.

Regards,
ARI Soft

Re:How 2 use ?

Posted by wOrker - 2011/05/12 12:13

Well will create a few articles on the pattern and write to you, by the way and you have a time zone, and to how many on the forum here?

PS: I've already figured out how the module works, correct errors, links have appeared =)

Re:How 2 use ?

Posted by wOrker - 2011/05/12 12:36

three articles are ready, will look something like this as I have guides on them. Here is their ID 61, 62, 63 are made on the same pattern, so will fit? Can the data for ARI Data Table is better at the beginning of start up or it does not matter?

Would you also help me with setting up a CSV based (example) table. I have spent hours and hours but did not succeed yet.

Thanks for your reply.

Thank you very much!

Re:How 2 use ?

Posted by wOrker - 2011/05/14 06:29

```
SELECT
SUBSTR(introtext,LOCATE('Name:',introtext) + LENGTH('Name:'),LOCATE('
```

Re:How 2 use ?

Posted by admin - 2011/05/14 11:42

Use "CHAR_LENGTH" instead of "LENGTH". Code will look like:

```
SELECT
SUBSTR(introtext,LOCATE('Name:',introtext) + CHAR_LENGTH('Name:'),LOCATE('
```
