Help with Layout

Posted by tiagoroffe - 2011/05/13 13:48

_____

I have the tables working fine and I'm using JQUery with the blitzer theme and I'm wondering how can I insert a css style that brings a light gray line between the columns. I have already tried working with the column settings and CSS styles but could not find a way. When I try the option Border, under html table, the line comes with no style.

I would appreciate some help.

Thanks

_____

Hello,

Could you provide link to page where we can see the table on your site?

_____

http://www.canfitpro.com/en/test-table

And I also wonder how to make the information in the rows be aligned to the top. But I guess I will figure that out once I know how to work with styles.

_____

Try to add the next CSS rules to "CSS Styles" parameter in module settings:

TABLE.display TBODY TR
{
 vertical-align: top;
}

TABLE.display TBODY TR TD
{
 border-bottom: 1px solid gray
}

It worked fine thanks, but I still dont know how to work withthe column settings. For example, if I want al the information

of a column to be bold, how do I do? I gave an ID name to colums and tried to use this ID in the CSS Style box with a style but it didn't work.

_____

You can enter specific CSS classed for necessary column in "Columns Settings -> CSS Class" parameter. For example you can set "CSS Class" parameter for "Name" column to "col-name" and then add the next CSS rule to "CSS Styles" parameter:

TABLE TBODY TD.col-name
{
 font-weight: bold;
 color: red;
}

Thanks! It's working. I figured out that the ID name should be exactly the same of the column header. Thanks again.
