
How to break up a long row?

Posted by jasonlough - 2011/05/20 21:17

I have a data set that, when output by ari-data tables, is wider than the area it resides in. It would be nice if there was a way to break a row into multiple rows. For ex :

id name age height weight

Turn that into

id name age

height weight

Hello,

Columns from one row can't be shown in multiple rows. It will be not table output. "ARI Data Table" widget can show table with scrolling, see "ARI Data Table -> Scroll Width" and ""ARI Data Table -> Scroll Height" parameters.

Regards,
ARI Soft
