## Working with parameters or variables

Posted by fertrob - 2011/06/10 06:17

---

I want to use ari datatable to show swimresults in our swimclubwebsite.

What is want to do is to show all the swimevent in one saison. A swimevent has a unique key. This key i want to pass to another ari datatable which then show the swimmers with their results who participate in that swimevent.

Is it possible to pass the unique key to another ari datatable.

Hello,

If results are stored in database, it is possible to pass key through request variable to another page.

That's great, can you give me an example.

Table 1 (Swimevent)  
column 1: Id  
Column 2: NameEvent

Table 2 (Swimresult)  
Column 1: ResultID  
Column 2: EventId  
Column 3: SwimmerId  
Column 4: Result

Aritable 1 has sql:

Select Id, NameEvent from Swimevent

On click in aritable 1 ,aritable 2 has to bu updated

Aritable 2 has sql:  
Select SwimmerId, Result From Swimresult wher EventId = ??

How must i fill in the ??

---

For example, if the second module instance (with sub-details) is loaded into separate article with ID equals to 74. Open the first module instance (for main details) settings page, find "Columns settings -> Columns settings" parameters section and set "Columns settings -> Columns settings -> ID" to Id and "Columns settings -> Columns settings -> Format" parameter to `index.php?option=com_content&view=article&id=74&eventId={ $value }` value.

After this use the next SQL query for the second module:

```
SELECT SwimmerId, Result FROM Swimresult WHERE EventId = { $REQUEST:eventId }
```

PS: If you wish, you can provide temporary access to your Joomla! backend by email, describe where you want to use the module and we will help to configure it.

Hello admin, thank you for logging in to the backend of my site and resolve this problem. My next question is now: Is it possible to pass multiple variables to another query in the same hyperlink

For example:

```
SELECT SwimmerId, Result FROM Swimresult WHERE EventId = { $REQUEST:eventId } and  
SwimmerId={ $REQUEST1: SwimmerId }
```

Add SwimmerId request variable in "Columns Settings -> Format" parameter for the first module and you can use it in the second module in the next way:

```
SELECT SwimmerId, Result FROM Swimresult WHERE EventId = { $REQUEST:eventId } and  
SwimmerId={ $REQUEST:SwimmerId }
```

Hello,

You can place drop down box outside the module and reload the page with selected value in drop down box.
