## \$columns iin the link

Posted by enricocerica - 2011/06/28 07:16

---

Hi,

I'm trying to use the \$columns value in a link but it doesn't seem to work and it is not substituted by the column value.  
Here is the content of the format field :

{ \$value }

The \$\_get returns the value { \$columns:numero }

The { \$value } is correctly replaced by the expected value.

I'm using the 1.5.23 version of the module, is there something special to set to make it work ?

Thanks

=====

Hello,

Could you provide SQL query or CSV which you use by email?

It seems that there is a delivery problem with the provided email so here is the query :

select s.num as Numero, s.naam as Nom,s.adres as Adresse,s.postnr as codePostal, s.lokal as Localite, s.telnr1 as Telephone

from cptcig/signal s

where s.klr='C'

and (s.num = { \$REQUEST:numcli } or { \$REQUEST:numcli }='0')

I tried with { \$columns:numero }, { \$columns:Numero }, { \$columns:num } and { \$columns:s.num }.

Column names are case-sensitive. Use the next code:

{ \$value }

If it doesn't help, could you provide link to page where we can see the problem and temporary access to your J! backend by email?

It doesn't work at all. I also tried to simplify the query by using the original table fields without renaming them and I have the same problem.

Unfortunately the site is an intranet and I cannot provide any access to it.

What is the php script where this functionality is processed ?

It finally works but I had to use all upercases for the field name even if I used Numero in the query :

{ \$value }

Have you connected to Joomla! database or to external database?

---

I'm connected to an external database.  
If I use the field name in full uppercase, it works fine.

It can be a specific feature of PHP extension for DB which is used on your remote server.
