
And another question

Posted by pot1906dk - 2011/07/04 08:55

I have a table containing a large calendar. To show it I use a standard ARI Data Table module.

But I would also like to be able to display partial calendars, creating one calendar for each user. This can of course be done by creating multiple instances of the module, but as the number of user calendars might exceed 1000, this solution is not possible.

It would be nice to use the ARI Table as a plugin like {ARITable id='55' userid='6465'} to show a calendar with all entries for user 6465 using the ARI module with id 55. This is just a thought, but is it possible to do what I need in some other way?

Hello,

If necessary to use the module as plugin, "Modules Anywhere" plugin can be used for this purpose. More details can be found [here](#). The plugin supports ability to override module parameters.

Regards,
ARI Soft
