## sql query - join supported?

Posted by chanpeter88 - 2011/08/31 03:59

---

i want to display the alphauserpoints history (jos\_alpha\_userpoints\_details) for current login user only. the history table does not contain userid directly.

1. history table

jos\_alpha\_userpoints\_details

id, referreid, points,

2. map alphauserpoints userid to joomla userid

jos\_alpha\_userpoints

id, userid

pls advise if the sql query contains join between these 2 tables, will this be supported?

Hello,

You can use the next SQL query in "ARI Data Tables" extension:

```
SELECT
  AUD.id,
  AUD.referreid,
  AUD.points,
  AU.userid
FROM
  jos_alpha_userpoints_details AUD INNER JOIN jos_alpha_userpoints AU
    ON AUD.id = AU.id
```

DESC does not work. it is still ASC

=====

```
SELECT
  AUD.id,
  AUD.datareference,
  AUD.points,
  AUD.insert_date,
  AUD.expire_date
FROM
  jos_alpha_userpoints_details AUD INNER JOIN jos_alpha_userpoints AU
    ON AUD.referreid= AU.referreid
WHERE
  AU.userid = {$UserId}
ORDER BY AUD.insert_date DESC
```

It should work, it can be a problem with module configuration. We can investigate the issue, if you provide link to page where we can see it and screenshot of module settings page or temporary access to your J! backend by email.
