
Master/Detail Page using CSV source

Posted by joshyoung - 2011/09/06 20:02

Could you give me the HTML code for a hyperlink from a master table column that will link to a detail table in another article on the same page? I want the ID code to be the selector for the detail page. I know the FORMAT code in the master column should be something like:

{ \$value }

And then...what selection criteria should be used in the detail FILTER specifications? I again assume it would be something like

COLUMN NAME/ID EQUALS \$ _get

Hello,

For example if ID of the article which contains secondary table is 75, use the next code in for primary table:

{ \$value }

Use the next "WHERE" clause for primary table to select specific records based "selectID" request variable:

....
WHERE
ID = { \$REQUEST:selectedID }

PS: This approach is working for data from a database.

Thank you. This helps but I am using a CSV file as the source. Does this approach work with a CSV?

Unfortunately not. The extension doesn't support ability to use request variables for CSV filters.

Thank you. I still can't get the detail table to select the record when using a DB, not CSV. The site is <http://www.2011efd.com/>

The

Could you provide temporary access to your J! backend by email so we could investigate the issue?

Try now please. It didn't work because incorrect SQL query was entered.

Thank you for your quick response. I see what has to happen. The SQL command is:

```
SELECT
`company`,
`Photos`,
`index`
FROM
`imageTesting`
WHERE
`index` = {$REQUEST:SELECTEDID} [where SELECTEDID was defined in the master table 'format'
```

Sorry, but the module doesn't provide this ability.
