PHP code as parameter for an SQL query

Posted by ecaraig - 2011/09/09 10:52

_____

Dear All,

thank you for the great extension, am using the Smart content set.
Currently have one problem and would appreciate your advice:
I need to filter my table (retrieved via the ari sql table from external ms sql server) by ids from the internal database, e.g.
Select * from #__users where id not in ($my-sqlfilter-here).
I have a working php code for the filter and have several options:
1. Adding the php code somewhere in the ari table, not sure if possible
2. Add the php code outside using jumi and have ari table filter by a variable, not sure how.
3. Add the whole php page with code and resultant table. This works but arijtable around the jumi code does not give ability to search/paging etc...

Thanks!

P.S. Is there any more documentation on the plugins, i.e. how to add column format to the article tags etc...

==

Hello,

You can use DirectPHP plugin to embed PHP code into an article.

Could you explain what you mean under "how to add column format to the article tags"?

Regards,
ARI Soft

_____

Thanks a lot!
I tried jumi to include my php file and it did not work, the ari datatable functions (search, sort, ect...).
Regarding the column format: There are a lot of discussion on how to add hyperlinks etc... in the module it can be done through the settings. The question is how to do it inside the article table, are there any tags for that and if so, where all these tags are documented.

_____

If you want to format a value, use "Columns settings -> Format" parameter.
