
parametric sql query

Posted by acevk - 2011/09/10 18:06

Hi i just bought Ari Data table module.

I have one separate mysql database from my Joomla installation where the first table has "Questions" and the second table has the "Answers". I created two modules of Ari table. The first displays inside an article the entire table of the "Questions" where article&id=1 and i have managed to create a link on a primary key "QuestionId" column:

sample:

{ \$value }

How i will link the value of the table column QuestionId from questions table (as i did in the sample) with the answers table.

Ideally when i click on primary key link of questions table i would like to display the relates "answers" from answers table. (Master Detail approach)

Please advice...!

Hello,

Request variables can be used in a SQL query. For example, if answers table contains "QuestionId" column, you can use the next SQL query to select answers for specific question:

```
SELECT
*
FROM
  answers
WHERE
  QuestionId = { $REQUEST:QuestionId }
```

I tried some changes...

I changed the hyperlink for the first column of the Questions table so all Questionid columns call the same article for the answers parametric query

{ \$value }

<http://www.ari-soft.com/images/fbfiles/images/questions.png>

I created a second Ari table module with the query that you suggested me with the query:

```
SELECT
*
FROM
`dbo.Answers`
where QuestionId={ $REQUEST:QuestionId }
```

and the result was : No data available

i enable the SQL Debug mode and i have that results

(mysql): SELECT * FROM `dbo.Answers` where QuestionId=
Error (1064): You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version
for the right syntax to use near " at line 5
No data available.

when i run an example of the second query for specific QuestionId

```
SELECT
*
FROM
`dbo.Answers`
where QuestionId=900
```

Everything is ok

So something is going wrong with the part of the query "where QuestionID={\$REQUEST:QuestionId}"

Please give me your email to provide you with the credentials of this site if you are able to take a look...or please advice me...

Thank you in advance!

Try now please. "Format" parameter should look like:

{ \$value }

Thank You very much !!!!!It is exact what want to have!

It is the first time that a support provide so fast a solution!

I should report it in Joomla forum also...That kind of modules and so good support should be mentioned!!!!

Thank you again!!!!
