
How to fix decimal # problem in table columns

Posted by corkcork - 2011/12/03 23:18

Hi,

I have imported a CSV file into my ARI table and two of the columns contains numbers with decimals and commas. The numbers before the decimals and commas does not show.

For example:

\$39,042.51 looks like ,042.51 in the table column.

\$3.05 looks like .05 in the table column.

How do I fix this?

Thank you.

Hello,

Could you send a CSV file and screenshot(s) of module settings page by email so we can investigate an issue?

Regards,
ARI Soft
