## make column linkable

Posted by iain simpson - 2011/12/12 13:41

---

hi, in my database I have a field for a website address for each member, when I make the table it looks like this :  
member name | location | website address  
at the moment the website address column is showing the members website address but it is not linkable, how can i make the address so that when people click on it it opens the members website ?.  
many thanks  
iain

Hello,

Open module settings page, find "Columns settings" parameters section and set "Columns settings -> ID" to website address value and "Columns settings -> Format" parameter to Link value.

Hello,

It is possible. For example if you want to use value from "col1" column, use {\$columns:col1} predefined variable in "Columns Settings -> Format" parameter.
