Hello,

The extension supports Joomla! 2.5.

Regards,  
ARI Soft

It won't let me input External database info like it did in 1.5. I see where I can change the source from Joomla Database to External Database, but when I change that, it doesn't give me the options for the external database like user name, location, type (ie. mssql, etc.) like it does in 1.5.

Just kidding. It's not working.

It won't save the external database information. Every time I hit save, it reverts back to the Joomla Database selection... ? What's up with that?

More information:

2.5 install. Uploaded the 1.5 module of Ari-data tables.

When I open the module and click on something like Table type and try and change it to AGIChart or ARI Table Sorter, etc. usually it is suppose to change the setting below. It doesn't Same with changing Database Type from Joomla Database to External. I can change it, but it won't show the parameters underneath...

So, I turned on debugging on Global Config. Then went back, and viola, it works. But not really. It shows me the parameters for External Database now, but when I hit save, it reverts back to Joomla Database and doesn't save any of the info I've saved.

---

That's my story...

OK!!! Just read the other forums about nothing working, installed the plugin and it's working now!!!

Hello,

Install and enable "System - ARI Extensions" plugin. This fact is described in readme.txt file from extension's archive.

Do you have a brief guide on how to use this extension.  
Thanks

Hello,

Choose in module settings table widget, data source (a database or CSV file) and configure common module parameters (menu assignment and others). Detailed help can be found on module settings page.
