Link table column to contact form
Posted by misterg2 - 2012/02/28 10:16

_____

I have a table that contains a member number and I want to use this number to link to an email address - hopefully hidden. Is this possible in ARI Data Tables. Alternatively I would have another lookup table with both member number and email address contained in it.

_____

Hello,

Do you use a contact form extension which can read member id from a request variable?

Regards,
ARI Soft

_____

I am using Fox Contact form for my web contact facility. I have not yet decided whether to use this for the member to member contacts. I am happy to change this if there is one that provides the facility you mention. Not sure what a request variable is though. Thnx for the fast response.

_____

The module can generate links based on selected data from a database or a CSV file. It possible to generate link for a contact form, but it requires that contact form extension can get member ID from a request variable.
