
Variables in ARI Data Tables - SQL query

Posted by hosker4u - 2012/03/01 12:29

Is it possible to pass a variable to a Ari Data Tables module?

Instead of creating 101 different Data Table Modules with small SQL Variations : What I want to do is pass a variable to the Module on a page.

Variables: UserID, UserType, etc... Is not suitable but a great feature.

Hello,

It is possible to use a request variables in a SQL query. For example if necessary to use "var1" request variable, use the next code {\$REQUEST:var1}

Example:

```
{aridatatables moduleId="93" lenderid="2"}
```

on another page:

```
{aridatatables moduleId="93" lenderid="3"}
```

Then LenderID is passed to SQL Query.

wow, your fast at replying. Its great to know..

So in SQL query I can put {\$REQUEST:var1}
Where do i set var1? in the URI or in module code?

That is great and will save me some time, its no good for SEO though.

I can display the table using GET for a specific category, but not able to put Category Name as the "Article Title".

Is it possible to pass variable via like my example? or something similar?
{aridatatables moduleId="93" lenderid="2"}

I THINK - this says its possible but not sure.

I know this is an old topic, need to know if this solution should also work with the Smart content like:

{arimodule id="93" lenderid="2"}/{/arimodule}

I just can't get it to work!

Update "ARI Smart Content" v. 2.2.29 (it updates "ARI Smart Content - Load Module" plugin to v. 1.0.2) and use {\$VAR:lenderid} variable in "WHERE" clause of SQL query. A sample query:

```
SELECT
id,
title
FROM
tbl
WHERE
({$VAR:lenderid|empty:""} = " OR id = {$VAR:lenderid|empty:"})
```
