Datatables do not want to save after editing
Posted by ettienned - 2012/05/17 14:16

_____

Hi
After i edited the datatable module and click the save nothing happens.I IE i get the following error.
I am using joomla 2.5

has anybody experinced this

regards
ettienne du plessis

_____

I have just tried it in Chrome and firefox . i do not see any errors in these but the save or close does not work.

All the other modules works fine. i can also edit and save Content - ARI Data Tables as well as System - ARI Extensions

It has to be something with the Module it self and joomla 2.5

_____

Hello,

Check that "System - ARI Extensions" plugin is enabled. If it doesn't help, could you provide a temporary access to your J! backend by email so we can investigate an issue?

Regards,

ARI Soft

_____

It was a conflict with "jQuery Easy" plugin. Download the latest version of "ARI Data Tables" module and upgrade it on your server. After this clean browser's cache. It should help.

Regards,
ARI Soft

_____

thanks for the prompt reply.

Can these grids be populated base on sql para
meters or should the params

_____

The module can show data from a database based on "SELECT" SQL query. For this set "Choose source type" parameter to "SQL" and enter an SQL query in "SQL -> SQL query" parameter.

_____

how do i pass a parameter to a paramerised query

===

Re:Datatables do not want to save after editing
Posted by admin - 2012/05/18 11:36

_____

Explain in more details what parameters do you mean? It is possible to use in "WHERE" clause of "SELECT" SQL query predefined variables like {$UserId), {$UserLogin} and etc. It is also possible to use request variables in the next format:

{$REQUEST:key}

Where "key" is a name of a request variable.

Regards,
ARI Soft

_____

hi
exactly that a parameter in the where clause .
What i would like to do is click on a row in the grid and pass a parameter to another article . the query in the new article must accecp the parameter from the the previous article. hope this makes sense

_____

You can use "Columns Settings -> Format" parameter to create a link from a main table to a secondary table and send a value as request parameters. For example if a main table contains "id" column and a secondary table is loaded into article with ID = 71 and you want to send "id" parameter from a main table to a secondary table. Set "Columns settings -> ID" to id and "Columns settings -> Format" to the next value:

{$value}

in main table module settings. In a SQL query of secondary table you can use {$REQUEST:pId} parameter.

_____

If you provide a link to a page where you use the module and a temporary access to your J! backend by email, we will help to configure the module.

_____

HI
I have managed to pass the parameter to the secondary table. I just need help with the main table by creating a link and passing the parameter to the secondary table
