Hello:

We would also like to do that a Search button be present and that the search be done only when it's clicked on - not OnKeyUp. Could you please also help us?

Thank you,
John.

Hello,

The extension doesn't support ability to disable search when "Enter" key is pressed.

Hello. Basically, we would like that a search be done only when user presses a Search button and not while writing as currently. How could we do this?

Thank you, John.

We want to do this to increase performance in our case. There is a table who has around 49 000 entries.

Hello. I bought the ARIData Tables extension but it already expired (the support expired; I don't see the product in Member Area); does this matter?
Thank you,
John Morales.

Hello. We already had a chat through emails. We still need to do this way (have search button). It doesn't matter if I need to modify code; I am a web developer. Anyway, could you guide where I may need to modify? I have read some stuff in datatables.net and checking over your aridatatable extensions.

Thank you,
John.

Hello. What about implementing this plugin: <http://datatables.net/plug-ins/api/fnSetFilteringDelay> ?

Thank you,
John.

We have sent the solution by email how to show a search form before a table.

Regards,
ARI Soft

It requires custom modification of the extension to add this plugin.

Regards,
ARI Soft

Hello. I am examining your extension's code. I am committed to customize the code if it's necessary. However, could you please guide me in the right direction to jump in the learning curve and customize the source code as soon as possible? I am a web developer.

See `\modules\mod_aridatatables\includes\kernel\DataTables\Models\class.DataTablesWidgetDatatableModel.php` file. All required javascript and CSS files are loaded in this file and javascript code which is used to initialize datatable is also in this file.

Regards,
ARI Soft

Re:Add Custom serch Button

Hello. Thank you very much. I am going to work at it.

Thank you,
John Morales.

Re:Add Custom serch Button

Posted by adeshjohnson1 - 2014/11/01 16:17

Hello. I finally was able to make the table work in such way that a search is done only when the Enter key is pressed (not every keypress as currently). I spent various days to figure it out and finally achieved it (Thank God primarily!). I read various threads in forums; I tried fnSetFilteringDelay plugin for Datatables (datatables.net) too - to delay call to search while typing - without being able to make it work (maybe some people have done it successfully); anyway, this thread was very very useful for me: <http://stackoverflow.com/questions/14619498/datatables-global-search-on-keypress-of-enter-key-instead-of-any-key-keypress/>.

Basically, what I did was to modify the file told before by Admin:

\modules\mod_aridatatables\includes\kernel\DataTables\Models\class.DataTablesWidgetDatatableModel.php in the following way:

```
function initClientInstance($id, $params, $hiddenColumns, $mParams, $columnsSettings)
{
    $cfg = $mParams;
    $usejQueryUI = (bool)$params;
    if ($usejQueryUI)
        AriDataTablesHelper::includejQueryUITheme($cfg);

    $loadMethod = AriUtils::getParam($params, 'loadMethod', 'ready');

    $jsOptions = $this->getJsOptions($id, $params, $hiddenColumns, $mParams, $columnsSettings);

    $fixedColCode = $this->getFixedColCode(AriUtils::getParam($params, 'fixedcols', array()));
    $dtCode = sprintf('if (typeof(AriDataTables) != "undefined") AriDataTables.hideLoadingPane("#%1$s_wrapper");var
options = %2$s;options = function(oSettings) { adt_DataTable_DrawCallback(oSettings) }; var dt =
$("#%1$s").addClass("display dataTable").dataTable(options);%3$s',
    $id,
    !empty($jsOptions) ? AriJSONHelper::encode($jsOptions) : "",
    $fixedColCode
    //!empty($jsOptions) ? sprintf('/*$("#%1$s_wrapper").find(".dataTables_wrapper").addClass("ui-widget-content")*/', $id) : ""
);
    $custom_code = sprintf('$("#%1$s_filter input").unbind(); $("#%1$s_filter input").bind("keyup", function(e) { if(e.keyCode
== 13) { dt.fnFilter(this.value) } }');
    $id
);
    $document =& JFactory::getDocument();
    if ($loadMethod == 'load')
        $document->addScriptDeclaration(';(window || jQuery)(window).load(function() { var $ = window || jQuery; ' . $dtCode .
$custom_code . ' });');
    else
        $document->addScriptDeclaration(';(window || jQuery)(document).ready(function($) { ' . $dtCode . $custom_code . ' });');
}
```

Notice the bold expressions - between `<b>` tags (which must not be in the code) - which were those I added.

Thank you very much. It would be great Admin adds this option to search by Enter key instead of every keypress in the backend for next version.

I am using server-side processing with a large table (around 49 000 rows).
