
How to start?

Posted by ubeda - 2014/07/02 15:53

Good afternoon,

I just purchased and installed the ARI Data Table, but not to start. I see the module installed, but I do not know how to create the table.

Please can you tell me how to create a totorial tables and views for the user.

Thank you very much. Sorry for my translate.

Hello,

Do you want to show data from a database or a CSV file?

Regards,
ARI Soft

Hello,

I need to create a simple data base and include it in the Joomla database and save mostralalar in the user view Joomla.

Greetings and thank you very much

For example if you want to show IDs and titles of Joomla! articles in a table, set "Choose source type" parameter to "SQL" and populate "Choose source type -> SQL -> SQL query" parameter with the following value:

```
SELECT
id,
title
FROM
#__content
```

Sorry, do not know where to start.

I installed the ARI DATA TABLES in the "user1" from a test site (www.irdebaile.com).

Please could create me a first simple table and then can continue on my own?

For example a table "TEST" with the following fields:

Name (text)

Quantity1 (whole number)

Amount2 (whole number)

Total (Calculated Quantity1 + amount2)

Â Â Â

The administrator login details would be sent via private message. Although I would not mind sending them publicly because this is a test site.

Please excuse the translation since I use Google Translate.

Thank you very much.

The extension provides ability to show data from databases and CSV files, but it doesn't provide ability to create tables in a database. You can use an application like PHPMyAdmin to manage databases on your server. Usually it is available in hosting panel. If you have a problem with it, we can create a table for you on your site. You can send credentials by email.

Hi there,

Having a similar issue where i have installed the module but don't know how to configure it to enter data that can be displayed. Which method will be faster to load the data, a cvs file or database?

I have created a database through my hosting site control panel with access through PhpMyAdmin, how can i go about inserting data through PhpMyAdmin Table that can be displayed using the module? And if i decided to go with the plug-in how can i set this up as well?

New to this system, any information is appreciated.

Also, not cleared on the difference between a local joomla database and an external one. How is the local joomla database created? I assume that my PhpMyAdmin DB is external right?

Thank you,

Hector

Hello,

It is preferable to use a database if you have a large data.

"- Joomla! database -" option is selected if table(s) with data which you want to show is located in Joomla! database (where Joomla! tables are located). In this case the extension can use Joomla! DB connection and it doesn't require to enter connection parameters for DB. If your table(s) is located in not Joomla! database then it requires to specify connection parameters.

Thank you ARI Soft Team,

I'm planning on using the Database method but still don't know how to configure it. Any instructions?

And where do i go to input the Data to be displayed in the module?

Thank you,
Hector

Are your tables stored in Joomla! database or not?

The extension shows data from a database based on "SELECT" SQL query. It is entered in "SQL -> SQL query" parameter. For example the following query will select Joomla! articles ID and title:

```
SELECT
id,
title
FROM
#__content
```

Separate Database with access through PhpMyAdmin.

How can i enter the data to be displayed on the ARI Data Table Module?

Thank you.

Set "Choose source type" parameter to "SQL", set "SQL -> Choose DB type" parameter to "External database", set "SQL -> External database -> DB Type" to "MySQL" or "MySQL (mysqli)" value and enter parameters for database connection in "External database -> Host", "External database -> User", "External database -> Password", "External database -> DB

name" parameters. After this enter an "SELECT" SQL query which will selects data in "SQL -> SQL query" parameter.
