

# Revert data only showing one record

Posted by dafangwu - 2014/08/19 18:10

I am using Joomla 3.x, ARI Data Table module, and ColumnFilter plugin. I have a table with really long field names, so instead of showing that horizontally, I want to show several records side by side using "Revert Data" option.

However, that display only shows one header column and one record. I searched through this forum in the last several days and couldn't find an answer. I was trying to recall what options I changed since installing ARI Data Table. The only one is probably setting JQuery to local copy since Google CDN option won't work. What else could I have done?

Please help. Thanks!

Hello,

"Revert data" parameter is used for another purpose. If "Revert" parameter is enabled, the following data:

```
# | col1 | col2 | col3
val 1 | val 1-1 | val 1-2 | val 1-3
val 2 | val 2-1 | val 2-2 | val 2-3
```

will be converted to:

```
# | val1 | val2
col1 | val 1-1 | val 2-1
col2 | val 1-2 | val 2-2
col3 | val 1-3 | val 2-3
```

Regards,  
ARI Soft

Yes, what you described is exactly what I want. I figured out how to chart using google visualization, but still want to transpose/revert data for better display.

I installed this on a clean copy of Joomla 3.x and it works fine, so it is my particular environment that is causing problem. I'll keep trying to figure out. Thanks!
