
Include Query In Table Call

Posted by connell.gosling - 2014/08/28 00:48

Hi,

Is it possible to include the SQL in the call to an ARI data table? i.e. {aridatatables moduleId="88" SQL="SELECT * FROM TableName"}{/aridatatables}

My reason for this is that I'd like to use the same module settings but with a very slightly different query each time, on many pages. It is not practical to create a new module every time for the number of times I need to do this.

Thanks.

Hello,

It is possible to use Module Plant plugin for this purpose. It supports overriding parameter(s) of the module which is loaded. Plugin code will look like:

Hi ARI Soft, thank you for your reply!

I discovered an old thread over here that has helped me with my issue. By putting {\$REQUEST:param} in the query and then modifying variables available in request, I have achieved my goal.

This issue is resolved - thank you again for such great products and support :)
