
Content plugin in Columns Settings

Posted by wantoo - 2014/11/13 17:21

Hello,

I need to hide "full" value from a column on data table but let user see it through a kind of "tooltip". The (textual) value is too big to fit in a cell and break design so I thought it should be great to simply display an icon + tooltip.

I've tried "Format" field in Columns Settings (via nonumber tooltip plugin syntax):

{tip Info::{\$value}}{/tip}

Content plugin are not parsed :(

So I've tried another way using native J!3 bootstrap:

No error but no result too :(

Is there a way to activate content plugin in columns settings format? onPrepareContent somewhere in script? Or I've missed something?

Thank you for your knowledge ;)

Hello,

Do you load the module into an article and don't use "Server side pagination"?

Hello,

Yes, I load the module into an article but I use Server side pagination.

In this case data are loaded via AJAX and content plugins are not executed.

Oh, ok. Thank you for you answer. So I set Server side pagination to Off... same result, content plugin is not parsed again :(

Do you mean there's another way to include datatables than "{ aridatatables moduleId="97" }" (space are intentional)?

I have 5 AriDataTables modules included in one article. All modules are settled to ServerSide Pagination Off. I don't undersatnd really what's the case where content plugin are parsed then. Sorry.

Check "Ordering" parameter in plugins settings. Load "Content - ARI Data Tables" plugin before other content plugins.
