
ARI Smart Content - Data Table and serverside pag

Posted by dijkhuizen - 2014/11/16 14:06

Hi,

I'am using the module ARI Smart Content - Data Table. One of the databasefields consists of the plugincode to view one or more pictures with the integrated Sexybox. Untill now that works fine. Complement for the great work.

Because of the long loading time for the tabledata I switched to the option for "server side pagination". It delivers fast loading of the page and table but the link to the sexybox plugin doesn't work anymore. In stead the plugincode is displayed on the screen.

You can see it at my testsite: <http://test.liemersmuseum.nl/bidprentjes>

How can I get the integrated plugin sexybox working again?

Regards,

Menno Dijkhuizen

Hello,

We will add a new plugin for "Sexy Lightbox" application which will support ability to use the lightbox via HTML code and it will work with "Data Table" when "Server side pagination" is enabled. The update will be available within a couple of days.

Hello,

We sent the plugin and instructions how to configure it by email. Check it please.

Thank's for the plugin.

I tested it and the fields in the table with links are working fine.

But I've now a problem with searching in the table.

- with serverside pagination OFF the search behaviour was fine: I could search through all columns by filling the searchwindow with more then one searchword separated by a space. Just like the tables on your demo-pages.
- with serverside pagination ON the search is limited to only one column. Using a space after the first searchword is no longer possible.

Is there a way to get the original search method back?

regards

The extension is searching by all searchable fields using "OR" operator and a search string When "Server side pagination" is used. It doesn't split search string into several parts. For example if search string is "alex smith" (without quotes) and the following SQL query is used to retrieve data:

```
SELECT * FROM #__users
```

and "name" and "username" are marked as searchable then the query will be modified to:

```
SELECT * FROM #__users WHERE `name` LIKE '%alex smith%' OR `username` LIKE '%alex smith%'
```

Thank you for the explanation.
I will have to deal with the slow loading if I want to do a search over more then one column.

regards and thanks again,

Menno Dijkhuizen

The extension searches in all searchable column (which are marked as "Searchable" in query settings).
