Table Column vs CSV Column Position
Posted by CSSDAweb - 2014/12/14 17:30

_____

How do I get a specified (e.g. icon) column from a csv file to display is a specified (e.g. first) column position in a table? I have icon as the first item in the column settings, but it's showing up as the last column in the table display.

Hello,

Currently it is not possible. The extension shows column in order which is defined in CSV file.

A possible solution to swap "icon" column and "product" column (it is just a sample, but you can modify it for your needs) is set "Columns settings -> ID" parameter to icon value, "Columns settings -> Alias" to product value, "Columns settings -> Format" parameter to {$columns:product} value.

Also set "Columns settings -> ID" parameter to product value, "Columns settings -> Alias" to icon value, "Columns settings -> Format" parameter to {$columns:icon} value.

Regards,
ARI Soft

Thank you for the quick response. It sure would be nice to have an column ordering option as a part of the column settings.
