
Search by id code position

Posted by jakeatencio - 2015/02/24 21:17

I have an extensive database that uses a structured 8 digit coding identification system. The coding is setup that the first 2 digits are a first level identifier, the second 2 digits are a second level identifier, and the next 2 are third level identifiers. The database needs to be setup that if a search is only 2 digits that it only searches the first 2 digits of the id. If 4 digits, it only searches the first 4 digits, etc.

What we want to avoid, for example, is a 2 digit search returning results based on those 2 digits anywhere else past the first 2 digits.

Is this possible with your extension?

Hello,

It is possible with DataTable application from "ARI Smart Content" extension.

I have purchased and successfully installed the Smart Content and Data Tables. It is working perfectly for general searches, but I cannot figure out how to proceed with doing the specialized search that I have described above. Will you please provide some guidance on how to achieve this specific search goal?

Thanks.

If you want to search only by ID like described in your previous post, set "All columns searchable" parameter to "No" in "SQL Query" settings, enter a name of "id" column in "Columns settings -> ID" textbox and set "Columns settings -> Sortable" parameter to "Yes".
