
Getting data from Joomla database - basics

Posted by kmendis - 2015/04/13 06:56

Hi

I haven't got data for Ari Tables from MySql tables previously and just tried the example on the demo video Using Joomla

The SQL Query entered

```
SELECT
  id,
  title
FROM
  #__content
```

obviously the statement is incorrect
is it the last #__content?

How can I know the correct references?

Thanks

Hello,

Use the following query:

```
SELECT
  id,
  title
FROM
  #__content
```

Thanks It works
What did I do wrong?

Was it ...
#__content
How do you get the ____

One more question

Have Ari soft designed a software where we can type in the data into tables and then connect those tables to Ari Tables?
Does it has to be a CSV file or MySQL tables?

Kumara

#__ is replaced with Joomla! database table prefix.

Sorry, but we don't have an extension which provides ability to add, edit and delete data.

Very Clear.

However you have a excellent extension in Ari Tables. I think you should also provide data entry and editing which makes life easy for non-experts like me

Thanks
