## Searching on multiple rows Posted by Luiaard - 2015/05/03 20:50

Good day,

I'm new with Ari Soft so I have a lot of questions. FOr now my I would like to know if it is possible to search on different rows.

I have a table with 6 coloms, one of these is Size and another one is Color. I would like to have the possibility to searc for red (in color) and for M in size.

In general I would like to have a top row (for all columns) where I can put search items in.

I hope this is possible and would be pleased if you can tell me how to do this.

Best regards, Gerrit Spilt

Hello,

The extension doesn't support separate search by columns.

If you show data from a database, it is possible to create a search HTML form outside the module and send data from it to SQL query which is used by the module to retrieve data. Request parameters are used in "WHERE" clause of SQL query in the following way:

## SELECT

FROM tbl WHERE size = {\$REQUEST:size}

Regards, ARI Soft
