
Help with query

Posted by arne.kristian.mo@retura.n - 2015/05/05 07:16

Hello,

We have a competition at work where all register their workout.
I use ARI Data Tables to present the results for the whole group.
It's on our intranett, so all have to log in to register. The logged in user name is stored with the data.

Some users want to see their own workout results, but don't want everybody else to see the data.

Is it possible to use the Joomla! user name in the query in any way to get individual queries? Can I use \$user = JFactory::getUser(); in the SQL query in any way?

Regards,

Arne Kristian

Hello,

Use {\$UserLogin} or {\$UserName} variable in WHERE clause of "SELECT" SQL query. For example:

```
SELECT
*
FROM
#__users
WHERE
username = {$UserLogin}
```

or

```
SELECT
*
FROM
#__users
WHERE
name = {$UserName}
```

Regards,
ARI Soft
