
Pie Chart size has changed since update

Posted by kefford - 2015/08/26 14:37

Hi,

I am noticing that since I updated to the latest ARI DataTables version that the sizes of the pie charts and my site are no longer the same. All the charts are displaying smaller. The size is set to 50% and I have the module set to display both the pie chart and the table with an overall size set to 500 wide x 300 high.

Before the update the pie and the table both filled across the allocated 50% of the page. Now the pie is shrunk down to display about 30% while the table is the same, using the full 50%.

Why was this changed? Was this intentional? How do I fix this and get back to how it was displayed before, without manually editing each individual module instance? I have a ton of ARI module instances and all were set at displaying how I wanted, but now all are showing the same behaviour.

Thanks.

Ken

Hello,

Is it possible to see the problem?

Go to this page,

<https://sim-x.net/index.php/simulators-region.html>

and select "Full Flight Simulator" under Simulator Type, then hit FILTER.

Previously, the pie and legend was bigger and filled the same horizontal space as the table below. Both the chart and table are generated from the same ARI DataTables module instance.

You can use "Choose table type -> ARI GChart -> Font size" and "Choose table type -> ARI GChart -> Legend font size" parameters to increase font size for titles and lables which are used for the graph.

Sorry but I am not sure how that helps. The settings have not been changed from what they have been since the pages were built so why has the overall pie chart scale changed?

I have no desire to have to edit each individual module instance manually. I still do not know why this happened. What does the font and legend size now have to do with overall scaling?

The overall size was good from the outset, and now after updating to 1.15.0, the latest version, the scale has shrunk noticeably. Why?

We don't change any style settings in the latest version of the extension. It contains changes only on module settings page. Some parameters were re-ordered and some where moved to another tabs.

Ok, I understand how that may be the case, but something has changed. What is preventing the pie chart from NOW using all of the "50%" space that has been allocated? Previously, it used the full space with less white-space on the left and right.

Thinking that there might not be sufficient height allocated I tried increasing the height. All this did was put white space before and after the table, the pie remained the same shrunken height, with too much white space left and right.

It is easy to see the left white space, the whole pie chart is now shifted in to the right. Previously it had little to no white space on the left and was bigger. Hence why I am asking.

We added "Chart area height" and "Chart area width" parameters to configuration of pie chart to v. 1.15.1. Set them to 85% and 90% value for example.

Thank you very much, that should do the trick.
