
Adding Link to my csv file

Posted by julan - 2015/08/27 22:28

I've been going through the forum looking for a solution to get links to work, but I just can't seem to get it to work.

I know since I'm using the a csv file, I need to use the Column Settings in the Formatting to insert links. I got it to insert link, but in uses that same link for everything in that column. How do I get each item in the column to have their own links?

Basically this is a table with Meeting Info - so one of the columns is Agenda and another is Previous Week. Under each are dates that I want to link to specific pdf files.

Thanks and looking forward to your response.

Julan

UPDATE:

Figured out my issue - I was trying to insert links into Table Type: ARI DATA TABLE instead of just HTML Table. Once I switched it back, it worked. Is it possible to do what I'm asking for in ARI Data Table? I like how it can sort... :-)

Thanks,
Julan

Hello,

Links are stored in separate column in CSV file or how these links should be generated? What value do you use in "Columns settings -> Format" parameter?

Regards,
ARI Soft

I don't have the link in a separate column. I have it setup like this:

But what happens is this link gets linked to all the values in the column.

It should be:

{ \$value }
