
Multiple Column Search With Server Pagination

Posted by sdckey - 2015/12/05 19:19

We're experiencing performance problems with two tables one of which is display 5k+ records; the other, 30k+ records.

Server-side pagination goes a good way to fix the performance issues but the search functionality is much reduced.

For instance, searching for 'simon key' without server side pagination works but searching with server pagination fails. In this example 'simon' and 'key' are to be found in separate columns.

Any suggestions?

Hello,

When server side pagination is used, the extension searches all search string in all columns. It doesn't support another behaviour, it requires custom modification of the extension.

Regards,
ARI Soft
