## Displaying in TAB Plugin

Posted by taoh - 2017/04/03 23:26

---

Hi

i have 4 Data Table modules which use different queries so as I understand it I can't use a TAB Module to display them, so I am trying to use the TAB Plugin.

I defined the 5 tabs I need with simple text data and they show properly, I added two modules and still OK, however when I the third Data module the tabs break (see attached)

Further investigation shows that it's the third module that breaks the TABS.

if I create an with

```
{tabs} {tab title="Marital Index - First Person"} Tab1{/tab} {/tabs}
```

in it , it shows correctly but if I have

```
{tabs} {tab title="Marital Index - First Person"}{arimodule id="181" comment="Innes Marriages - Forename"}{/arimodule}{/tab} {/tabs}
```

The table show OK and works BUT I get {tabs} {tab title="Marital Index - First Person"} showing above it and {/tab} {/tabs} below it.

The actually data is 1613 rows in a 10 row grid of 5 fields and the only thing I changed in the new module was the them (aristo). After playing with the settings, if I switch on server side paging it displays in a TAB OK but the formatting goes weird as one field that if of HTML type shows the unprocessed HTML text. In addition fields marked as sort=no show the sort arrows.

Ideas Please!

Niall

Hello,

Could you provide a link to a page where the problem occurs and a temporary access to your J! backend by email so we can investigate the problem?

Hi

Tabs and grids all working fine now however I would like to know how to set the font attributes in the datatable for both header (field names) and data.

Cheers

Hello,

Add the following CSS rules to a site template CSS file or to "CSS Styles" parameter in module settings:

---

table.dataTable TH {font-size:25px}  
table.dataTable TD {font-size:10px}

Thanks for that . Do you know where I can get a sensible article that tell me which part of the table is which, There are several changes i would like to make but all the articles I've turned up so far assume the reader knows more that I do so although I am reasonably sure of things like font properties, I dont know where to ally them e.g the parts that hold the search box and the one that holds the paging stuff.

Cheers  
Niall

If you have a technical knowledge, it is possible to use browser's developer tool to find an appropriate CSS class/element and then create a CSS rule.

Hi  
Sorry to be a pain but I know we sorted this problem by changing a setting somewhere but I can't find the email that tells me what that setting was.  
The test site is working perfectly but I'm now moving the set of articles to the live environment and it has the same problem with the two large datasets.

Cheers

Hello,

If a table with large data is not showing, try to install "PHP Settings" plugin and set pcre.backtrack\_limit PHP parameter to -1 value.

Hi

Thanks I remember now!

Cheers

Niall
