## HTML code...

Posted by Nicodemus - 2010/08/04 16:54

---

:unsure: Hi again.. x3 maybe you are annoyed with me... but i swear that is this the las question in months (or more) xD... but now i have another question... :P

When I'm using HTML URL's, and I use the sorting function, the value that the table takes is the URL?? not the name of the cell?

Example...

I'm using in a cell:

"Lima Culinary"

This is the Result...

[http://i70.photobucket.com/albums/i118/Van\\_Nicodemus/Untitled-1.jpg](http://i70.photobucket.com/albums/i118/Van_Nicodemus/Untitled-1.jpg)

Supposedly the alphabetical order will be...

Cusco y Machu Picchu  
Descubra Lima  
Lima Ciudad de los Reyes  
Lima Culinary  
Lima y sus encantos arqueolñfgicos

...

I Think that the table takes the value of the the symbol "

I'll also need this issue corrected before I purchase ARI Data Tables.

---

It was fixed in 'ARI Data Tables' v. 1.3.1. 'ARI Data Table' widget provides possibility to choose sorting method (string, HTML or other) for specific columns.

Regards,  
ARI Soft
